PROFESSIONAL SUMMARY

Senior full-stack software engineer with **20+ years** building large-scale, production backend services, APIs and data platforms. For the past several years I have designed and shipped **production GenAI systems** at Microsoft Bing Ads — LLM-powered advertising-asset generation, automated ad-quality scoring, and brand-intelligence.

Strong ownership mindset (previously owned a public advertiser-facing API/SDK end-to-end), fluent in **AI-augmented / agentic development** (GitHub Copilot, Claude Code), and equally comfortable across backend services, data pipelines and ML delivery.

TECHNICAL SKILLS

- **Languages:** C# / .NET, Java, Python, Node.js / JavaScript, C / C++, SQL
- **GenAI & ML:** LLM application development (GPT-4, GPT-5, Azure OpenAI), prompt engineering, self-hosted / open-weight models (e.g. Mistral), image & video generation; **agentic coding assistants** — **GitHub Copilot, Claude Code**
- **Cloud & Microservices:** Azure, microservices architecture, RESTful API & SDK design, event-driven / distributed services, full-stack web development
- **Data:** Azure Cosmos DB, MS SQL Server, MySQL, Kusto; HDFS, MapReduce, Hive, Spark, Elasticsearch, Cassandra, Zookeeper
- **Engineering practice:** OOP & design patterns, Agile / Scrum, CI/CD, Git, test automation, release & incident management (ICM), performance tuning & observability

PROFESSIONAL EXPERIENCE

Microsoft (STCA) — Senior Software Engineer

May 2017 – Present · Beijing, China

Bing Ads — Advertising Platform & Applied GenAI

Applied GenAI for Advertising (recent focus)

- Built a **production GenAI advertising-asset platform** that generates **images and videos** for advertisers: crawls a target website, scrapes and ranks visual/textual content by **relevance**, and composes on-brand creatives from templates. (C#/.NET, Python, Azure)
- Developed an **automated ad-quality scoring service** that crawls and summarizes a landing page, then evaluates ad creatives against it — scoring **image quality & diversity** and **text-asset quality & diversity** — to power recommendations to advertisers.
- Created a **brand-kit generation** capability that scrapes a site to extract its **CSS color and font identity**, then recommends brand styling to customers and feeds it into asset generation for consistently on-brand output.
- Cut **end-to-end function-test (FT) time from 40 to 20 minutes**, accelerating release cycles with faster, more reliable regression feedback.
- Integrated LLMs end-to-end (**GPT-4/GPT-5, Azure OpenAI, self-hosted Mistral**) across **C#/.NET and Python microservices**, applying prompt engineering and evaluation to live ad scenarios.
- Practice **AI-augmented / agentic development** daily (**GitHub Copilot, Claude Code**) for implementation, refactoring, test generation and code review.

Bing Ads Campaign Platform — Middle-Tier API/SDK (earlier)

- **Owned the advertiser-facing Campaign middle-tier API/SDK end-to-end** — led its **maintenance and publishing** — the interface advertisers and partners use to create and manage their campaign demand. (Java, C#, Python, MS SQL Server, Cosmos DB, Kusto)
- Served as **release manager** for the middle-tier platform — **oversaw the end-to-end release process and release quality gates**, and **led production incident management (ICM)** across triage, mitigation, root-cause analysis and resolution.
- Delivered full-stack development across the campaign platform's middle-tier services, APIs and supporting tooling.

Quixey — Senior Engineer

Aug 2015 – Feb 2017

App / Deep Search — API Server & Content Platform

- Built **big-data ETL and content pipelines**, log-analysis systems, and a mid-tier service / API framework; designed and implemented service endpoints and drove performance optimization & tuning. (Java, Cassandra, Elasticsearch, Apache Camel, Spark, Zookeeper, Guice, EhCache, MySQL)

Sony Mobile Communications (SOMC) — Senior Engineer

Jun 2011 – Aug 2015

IDD / MTBF — Data Analytics Platform

- Stood up the initial **HDFS/MapReduce** platform on IDD data (~20 GB/day) and built a **MapReduce-based ETL framework** powering **20+ ETL processes**.
- **Cut data-analysis time by ~80%** (from hours to ~20 minutes) and **reduced storage cost by €7,000/year** by pruning ~30% invalid/stale data from a **90-million-record** table.

- Stabilized and extended a legacy MTBF system, fixing defects that had persisted for 4+ years after taking over maintenance ownership. (*Java, C#, SQL Server, MySQL, HDFS, MapReduce, Hive*)

CieNet — Technical Consultant

Aug 2007 – Jun 2011

SEMC Android/Symbian platform development tooling

- Implemented **autocruncher** / **cruncher-env** enabling users to deploy custom analyzers on IDD data; maintained a .NET MTBF system; maintained crash-log analysis tools (EriCallStack, ChkARM).
- Contributed to the **OpenGrok** open-source project (cross-branch comparison & source views, bare-clone indexing). (*Java, C, Perl, Git, MySQL, SQL Server*)

Gameloft — Senior Engineer

Jun 2003 – Jul 2007

- Created and ported **20+ mobile games**; optimized game engine, memory, performance and footprint (titles incl. *Rainbow Six 3, Might & Magic*). Helped establish the Gameloft Korea (Seoul) studio and delivered its first two titles. (*J2ME, C, C++, Python*)

EDUCATION

B.S., Computer Science (Software) — Tianjin University · 1995 – 1999

LANGUAGES

English — fluent (read / write / speak), CET-6 · Mandarin Chinese — native
